Dear Sir,

I am writing to complain about the amount of gum dropped around [REDACTED]. I have done some research using quadrants to find out how much percentage of gum there is per paving slab and have found these results

I have found that by the older blocks ([REDACTED] and [REDACTED]) and in the middle of the school grounds there is a lot of gum, however, by the new block ([REDACTED]) and by the whole left side of the school there is very little. Down the whole right hand side of the grounds there is a reasonable amount but not as much as found by the older blocks,

I think this has happened because of the age of the buildings and how busy it is around it. This problem can easily be resolved by putting out special boards that people can stick their gum on which can then be changed regularly. Another solution, which you may not agree with, is simply let people chew in class so they don't have to spit their gum out before the lessons.

With the information I have given above I hope you can see how much of a problem this is and why something needs to be done about it and hopefully my suggestions will be a help in resolving the issue.

Yours sincerely
